Package: CPSM (via r-universe)

October 19, 2026

Type Package

Title CPSM: Cancer patient survival model

Version 1.5.0

Description CPSM provides a comprehensive computational pipeline for predicting survival probability and risk groups in cancer patients. The package includes steps for data preprocessing, training/test split, and normalization. It enables feature selection using univariate survival analysis and computes a LASSO-based prognostic index (PI) score. CPSM supports the development of predictive models using various feature sets and offers a suite of visualization tools, including survival curves based on predicted probabilities, barplots for predicted mean and median survival times, KM plots overlaid with individual survival predictions, and nomograms for estimating 1-, 3-, 5-, and 10-year survival probabilities. This makes CPSM a versatile tool for survival analysis in cancer research.

`data_process_f` *Data Processing function*

Description

This function converting OS time (in days) into months and removing samples where OS time information is missing. Note: In the Example data OS time labelled is "OS.time" and OS event labelled as "OS"

Arguments

`data`	A data frame containing clinical and expression data.
`col_num`	An integer indicating the column number where expression data starts.
`surv_time`	A character string specifying the name of the survival time column in the data.

Value

A data frame combining processed clinical and expression data. Includes a new column `OS_month` for survival time in months, and retains only rows with positive `OS_month`.

Examples

```
library(SummarizedExperiment)
data(Example_TCGA_LGG_FPKM_data, package = "CPSM")
combined_df <- cbind(as.data.frame(colData(Example_TCGA_LGG_FPKM_data))
[, -ncol(colData(Example_TCGA_LGG_FPKM_data))],
t(as.data.frame(assay(Example_TCGA_LGG_FPKM_data, "expression"))))
data_process_f(data = combined_df,
  col_num = 20, surv_time = "OS.time"
)
```

`Example_TCGA_LGG_FPKM_data`
Example TCGA LGG FPKM data

Description

This is a data set used for the package example.

Usage

```
data("Example_TCGA_LGG_FPKM_data")
```

Format

A data frame with 184 observations on the following 2024 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

`histological_type` a character vector

`histological_grade` a character vector

`treatment_outcome_first_course` a character vector

```
data(Key_univariate_features_with_Clin_list)
## maybe str(Key_univariate_features_with_Clin_list)
```

km_overlay_plot_f *Overlay Kaplan-Meier Plot Function*

Description

This function generates an overlayed Kaplan-Meier (KM) survival plot to visualize the survival curves of training data stratified by predicted risk groups (e.g., High Risk vs Low Risk), along with the survival curve of a selected test sample. It helps to visually assess how the test sample's predicted survival aligns with the survival profiles of the training groups.

Arguments

`Train_results` A data frame containing the training samples' survival prediction results (obtained from RF risk prediction model). The following columns are required:

- `Sample_ID`: Unique identifier for the sample.
- `Actual`: Actual TCGA ID (often the same as `Sample_ID`).
- `Predicted_Risk_Group`: Predicted class label (e.g., `High_Risk` / `Low_Risk`).
- `High_Risk_Prob`: Probability of being classified as High Risk.
- `Low_Risk_Prob`: Probability of being classified as Low Risk.
- `Prediction_Prob`: Maximum class probability (confidence in the prediction).
- `OS_month`: Overall survival time in months.
- `OS_event`: Event indicator (`1` = death, `0` = censored). The data frame should have no duplicate `Sample_ID`s, and the `OS_month` column should be numeric while `OS_event` should be an integer.

`Test_results` A data frame containing the test samples' survival prediction results (obtained from RF risk prediction model). The structure is similar to `Train_results`, with the following columns:

- `Sample_ID`: Unique identifier for the sample.
- `Actual`: Actual TCGA ID (often the same as `Sample_ID`).
- `Predicted_Risk_Group`: Predicted class label (e.g., `High_Risk` / `Low_Risk`).
- `High_Risk_Prob`: Probability of being classified as High Risk.
- `Low_Risk_Prob`: Probability of being classified as Low Risk.
- `Prediction_Prob`: Maximum class probability (confidence in the prediction).
- `OS_month`: Overall survival time in months.
- `OS_event`: Event indicator (`1` = death, `0` = censored). The data frame should have no duplicate `Sample_ID`s, and the `OS_month` column should be numeric while `OS_event` should be an integer. The `Sample_ID` of the `selected_sample` must be present in this data frame.

`survcurve_te_data` A data frame containing survival probability curves for test samples. It should include:

- `time_point`: Time points for survival estimates.
- `<Sample_ID columns>`: Survival probabilities for each sample at each time point.

`selected_sample` The `Sample_ID` of the selected test sample for which the user wants to plot the overlayed Kaplan-Meier plot. The `Sample_ID` should be present in the `Test_results` data frame.

`font_size` Numeric. Base font size for the plot text (axis labels, legend, and title). Default is 12.

`train_palette` Character vector of colors for training group curves (e.g., c("red", "blue")). Default is c("red", "blue").

test_line_col	Character. Color of the overlaid test sample curve. Default is "darkgreen".
test_line_type	Character. Line type of the overlaid test sample curve (e.g., "dashed", "solid"). Default is "dashed".

Value

A ggplot object (from ggsurvplot) showing:

- Kaplan-Meier survival curves for the training dataset, stratified by predicted risk group.
- An overlaid survival curve for the selected test sample (in a dashed green line).
- Annotations displaying the test sample's predicted risk group and prediction probability.

Examples

```
# Example usage of the km_overlay_plot_f function

# Example Train_results data frame
# Load example data included in the package
data(Train_results, package = "CPSM")
data(Test_results, package = "CPSM")
data(survCurves_data, package = "CPSM")

# Generate Kaplan-Meier plot with overlay
KM_plot_results <- km_overlay_plot_f(
  Train_results = Train_results,
  Test_results = Test_results,
  survcurve_te_data = survCurves_data,
  selected_sample = "TCGA-TQ-A7RQ-01",
  font_size = 14,
  train_palette = c("purple", "orange"),
  test_curve_col = "black",
  test_curve_lty = "solid"
)
```

Lasso_PI_scores_f *Lasso-Based Prognostic Index Calculation*

Description

Lasso-Based Prognostic Index Calculation

Usage

```
Lasso_PI_scores_f(
  train_data,
  test_data,
  nfolds,
```

```
  col_num,
  surv_time,
  surv_event,
  n_repeats,
  alpha,
  freq_threshold = 0.6
)
```

Arguments

train_data	A data frame containing the training data, including survival time, event status, and features.
test_data	A data frame containing the test data, including survival time, event status, and features.
nfolds	An integer specifying the number of cross-validation folds for LASSO.
col_num	An integer indicating the starting column index for the feature variables.
surv_time	A character string specifying the column name for survival time in the data.
surv_event	A character string specifying the column name for survival event status in the data.
n_repeats	An integer specifying how many times repeated CV should be run to assess feature selection stability.
alpha	A numeric value (0–1) specifying the mixing parameter for Elastic Net (1 = LASSO, 0 < alpha < 1 = Elastic Net).
freq_threshold	Numeric value between 0 and 1. Minimum selection frequency required to retain a feature across repeated LASSO runs (e.g., 0.6 keeps features selected in > 60% of repeats).

Details

The function first checks the validity of input data. It renames the survival time and event columns in the training and test datasets, then fits a Cox proportional hazards model using Lasso regularization via cross-validation. Based on the Lasso model, the function calculates the prognostic index (PI) for both the training and test datasets, appending the PI values to the original data frames.

Value

A list with the following components:

- Train_Lasso_key_variables: A data frame of selected key variables and their coefficients.
- Train_PI_data: A data frame with training data, including survival time, event status, and PI.
- Test_PI_data: A data frame with test data, including survival time, event status, and PI.
- cvfit: A cv.glmnet object representing the fitted LASSO Cox model.
- Stability_table: A data frame showing each feature and the proportion of repeated CV runs in which it was selected (selection frequency).

Examples

```
data(Train_Norm_data, package = "CPSM")
data(Test_Norm_data, package = "CPSM")
Result_PI <- Lasso_PI_scores_f(
train_data = Train_Norm_data,
test_data = Test_Norm_data,
nfolds = 5,
col_num = 21,
n_repeats = 10,
alpha = 1,
freq_threshold = 0.6,
surv_time = "OS_month",
surv_event = "OS")
```

`mean_median_surv_barplot_f`

Mean and Median Survival Bar Plot

Description

This function generate barplots for mean and median survival of patients. Besides, user can also highlight one specific sample by providing sample IDs

Arguments

`surv_mean_med_data`	:args1 - Predicted Mean median survival time data for patients
`selected_sample`	:args2 - ID of the sample for which user want to highlight in the plot.
`font_size`	Numeric: Font size for axis text and labels (default = 8)
`font_color`	Character: Font color for text/labels (default = "black")
`bar_colors`	Named vector: Custom bar colors for highlighted and other patients. Defaults to: `c("TRUE.Mean" = "red", "TRUE.Median" = "blue", "FALSE.Mean" = "lightgray", "FALSE.Median" = "darkgray")`

Value

A list containing two `ggplot` objects:

- `mean_med_all_pat`: Bar plot of mean and median survival times for all patients.
- `highlighted_selected_pat`: Bar plot highlighting the selected patient's mean and median survival times with distinct colors.

Examples

```
data(mean_median_survival_time_data, package = "CPSM")
mean_median_surv_barplot_f(
  surv_mean_med_data =
    mean_median_survival_time_data,
  selected_sample = "TCGA-TQ-A7RQ-01",
  font_size = 10,
  font_color = "darkblue",
  bar_colors = c("TRUE.Mean" = "green", "TRUE.Median" = "purple",
                 "FALSE.Mean" = "lightblue", "FALSE.Median" = "gray70")
)
```

---

mean_median_survival_time_data

mean median survival time data

Description

This is mean median survival time data.

Usage

```
data("mean_median_survival_time_data")
```

Format

A data frame with 18 observations on the following 3 variables.

`IDs` a character vector

`Mean` a numeric vector

`Median` a numeric vector

Details

This is mean median survival time data.

Value

Data whch is used for plot.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(mean_median_survival_time_data)
# maybe str(mean_median_survival_time_data)
# plot(mean_median_survival_time_data)
```

`MTLR_pred_model_f` *MTLR Prediction Model Function*

Description

This function builds a Multi-Task Logistic Regression (MTLR) survival model based on clinical or selected feature or their combinations. It can handle various model types based on user input (e.g., Clinical features only, Clinical features with PI score, selected genes set).

Usage

```
MTLR_pred_model_f(
  train_clin_data,
  test_clin_data,
  Model_type,
  train_features_data,
  test_features_data,
  Clin_Feature_List,
  surv_time,
  surv_event,
  nfolds = 5
)
```

Arguments

`train_clin_data`
: A data frame containing the clinical data for the training set.

`test_clin_data`
: A data frame containing the clinical data for the test set.

`Model_type`
: An integer indicating the model type:

- 1: Clinical features model
- 2: PI score model
- 3: PI score with Clinical features model
- 4: selected gene set or clinical with selected gene set based model

`train_features_data`
: A data frame containing the feature data for the training set.

`test_features_data`
: A data frame containing the feature data for the test set.

`Clin_Feature_List`
: A list of clinical features to be used in the model.

`surv_time`
: A string specifying the name of the survival time column.

`surv_event`
: A string specifying the name of the survival event column.

`nfolds`
: An integer specifying the number of folds for cross-validation. Default is `5`.

Value

A list containing the following components:

`Model`	The fitted MTLR model.
`Error_matrix`	A matrix of error evaluation metrics (C-index and MAE) for training and test sets.
`Survival_predictions`	Predicted survival probabilities, mean survival times, and median survival times.
`Model_type`	The model type selected by the user.

Examples

```
# Example usage of the MTLR_pred_model_f function
data(Train_Clin, package = "CPSM")
data(Test_Clin, package = "CPSM")
data(Key_Clin_feature_list, package = "CPSM")
result <- MTLR_pred_model_f(
   train_clin_data = Train_Clin,
   test_clin_data = Test_Clin,
   Model_type = 1,
   train_features_data = Train_Clin,
   test_features_data = Test_Clin,
   Clin_Feature_List = Key_Clin_feature_list,
   surv_time = "OS_month",
   surv_event = "OS",
   nfolds = 5
  )
```

`New_data` *New data*

Description

This is New data.

Usage

```
data("New_data")
```

Format

A data frame with 176 observations on the following 2025 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

race a character vector

ajcc_pathologic_tumor_stage a logical vector

Details

This is New data.

Value

Retuens a dataframe.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(New_data)
## maybe str(New_data)
## plot(New_data)
```

`Nomogram_generate_f` *Nomogram Generation Function*

Description

Nomogram Generation Function

Usage

```
Nomogram_generate_f(
  data,
  Feature_List,
  surv_time,
  surv_event,
  font_size = 0.8,
  axis_cex = 0.5,
  tcl_len = 0.5,
  label_margin = 0.5,
  col_grid = gray(c(0.85, 0.95))
)
```

Arguments

`data`	A data frame containing survival information and predictor variables. Must include columns for survival time, event status, and selected features.
`Feature_List`	A data frame or list containing the selected features (column names) to be included in the nomogram.
`surv_time`	A character string specifying the column name for survival time in the input data.
`surv_event`	A character string specifying the column name for survival event status in the input data (1 for event, 0 for censored).
`font_size`	Numeric. Base font size for the nomogram plot. Default is 0.8
`axis_cex`	Numeric. Scaling factor for axis text size (cex.axis). Default is 0.5
`tcl_len`	Numeric. Tick length on axes (tcl). Default is 0.5
`label_margin`	Numeric. Margin for variable labels (lmgp). Default is 0.5
`col_grid`	Color vector. Grid line colors for the nomogram plot. Default is gray(c(0.85, 0.95))

Details

The function dynamically creates a Cox proportional hazards model based on the selected features and survival data. It computes survival probabilities for 1, 3, 5, and 10 years (if applicable) and plots the nomogram. The function uses internal validation with bootstrapping (B = 1000) to calculate the bias-corrected C-index.

Value

A list containing:

- `C_index_mat`: A matrix containing the bias-corrected and original C-index values.

The following steps are performed:

- Validates input data and renames survival columns to standard names.
- Prepares the data for modeling using `rms::datadist`.
- Dynamically creates a Cox proportional hazards model formula.
- Fits the Cox model using `rms::cph`.
- Generates the nomogram with survival probabilities at specified time points.
- Validates the model and computes C-index values.

Examples

```
data(Train_Data_Nomogram_input, package = "CPSM")
data(feature_list_for_Nomogram, package = "CPSM")
Nomogram_generate_f(
  data = Train_Data_Nomogram_input,
  Feature_List = feature_list_for_Nomogram,
  surv_time = "OS_month",
  surv_event = "OS",
  font_size = 0.8,
  axis_cex = 0.5,
  tcl_len = 0.5,
  label_margin = 0.5,
  col_grid = gray(c(0.85, 0.95))
)
```

---

predict_survival_risk_group_f

Survival Risk Group Prediction Function

Description

This function builds a Random Forest (RF) model to classify samples into high-risk or low-risk survival groups based on selected features.

Usage

```
predict_survival_risk_group_f(
  selected_train_data,
  selected_test_data,
  Feature_List,
  K = 5
)
```

Arguments

selected_train_data	A data frame containing normalized expression data of selected features and survival information for training set.
selected_test_data	A data frame containing normalized expression data of selected features and survival information for test set.
Feature_List	A list of features to be used for predicting the risk class in the model.
K	Numeric value specifying the number of folds for K-fold cross-validation (default = 5).

Value

A list containing the following components:

best_model	The Best RF model.
Train_results	Prediction resulst on Training data
Test_results	Prediction resulst on Test data
misclassification_results	Prediction results of best on model on training and Test data
All_tree_matrix	Prediction results on training and test data based on all models using different number of trees

Examples

```
# Example usage of the predict_survival_risk_group_f function
data(Train_PI_data, package = "CPSM")
data(Test_PI_data, package = "CPSM")
data(Key_PI_list , package = "CPSM")
Results_Risk_group_Prediction<- predict_survival_risk_group_f(selected_train_data = Train_PI_data,
selected_test_data = Test_PI_data, Feature_List = Key_PI_list, K = 5 )
```

---

surv_curve_plots_f *Generate Survival Curve Plots*

Description

This function creates survival curve plots for all patients and highlights a specific patient based on the selected sample.

Arguments

Surv_curve_data	A data frame containing survival curve data. The data frame must include a column named time_point representing time and other columns corresponding to patient survival probabilities.
selected_sample	A character string specifying the patient ID to be highlighted in the plot.
font_size	Numeric. Font size for axis labels, titles, and legends. Must be supplied by the user.
line_size	Numeric. Line thickness for plotted curves. Must be supplied by the user.
all_line_col	Character. Color used for all non-highlighted patients (e.g., "black"). Must be supplied by the user.
highlight_col	Character. Color used to highlight the selected patient (e.g., "red"). Must be supplied by the user.

Details

- The input data (Surv_curve_data) must be structured such that the first column (time_point) represents time points, and each subsequent column represents the survival probabilities for a specific patient.
- If the selected_sample is not present in the column names of Surv_curve_data, a message will indicate that the sample is missing.
- The function uses the ggplot2 package for generating survival curve plots.

Value

A list containing two ggplot2 objects:

all_patients_plot	A ggplot object displaying survival curves for all patients.
highlighted_patient_plot	A ggplot object displaying survival curves for all patients with the selected patient highlighted.

Examples

```
# Example survival curve data
Surv_curve_data <- data.frame(
  time_point = c(0, 1, 2, 3, 4),
  Patient1 = c(1, 0.9, 0.8, 0.7, 0.6),
  Patient2 = c(1, 0.85, 0.75, 0.65, 0.55)
)

# Generate plots with Patient1 highlighted
plots <- surv_curve_plots_f(
  Surv_curve_data,
  selected_sample = "Patient1",
  font_size = 12,
```

```
  line_size = 0.5,
  all_line_col = "black",
  highlight_col = "red"
)

# View the plots
print(plots$all_patients_plot)
print(plots$highlighted_patient_plot)
```

---

survCurves_data *survCurves data*

Description

This is survCurves data.

Usage

```
data("survCurves_data")
```

Format

A data frame with 15 observations on the following 19 variables.

`time_point` a numeric vector

`'TCGA-E1-A7Z6-01'` a numeric vector

`'TCGA-S9-A7IX-01'` a numeric vector

`'TCGA-P5-A5EX-01'` a numeric vector

Details

This is survCurves data.

Value

This is a data frame.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(survCurves_data)
## maybe str(survCurves_data)
```

`Test_Clin` *Test Clin*

Description

This is Test Clin.

Usage

```
data("Test_Clin")
```

Format

A data frame with 18 observations on the following 20 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

Details

This is Test Clin.

Value

A data frame with columns X and Y.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(Test_Clin)
## maybe str(Test_Clin)
## plot(Test_Clin)
```

---

test_FPKM *test FPKM*

Description

This is test FPKM.

Usage

```
data("test_FPKM")
```

Format

A data frame with 18 observations on the following 2025 variables.

Age a numeric vector

subtype a character vector

gender a character vector

race a character vector

ajcc_pathologic_tumor_stage a logical vector

histological_type a character vector

histological_grade a character vector

treatment_outcome_first_course a character vector

radiation_treatment_adjuvant a character vector

sample_type a character vector

type a character vector

Details

This is test FPKM.

Value

Returns a dataframe.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(test_FPKM)
## maybe str(test_FPKM)
## plot(test_FPKM)
```

Test_Norm_data *Test Norm data*

Description

This is Test Norm data.

Usage

```
data("Test_Norm_data")
```

Format

A data frame with 18 observations on the following 2025 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

`histological_type` a character vector

`histological_grade` a character vector

`treatment_outcome_first_course` a character vector

`radiation_treatment_adjuvant` a character vector

`sample_type` a character vector

`type` a character vector

`OS` a numeric vector

`OS.time` a numeric vector

`DSS` a numeric vector

`DSS.time` a numeric vector

`DFI` a numeric vector

`DFI.time` a numeric vector

`PFI` a numeric vector

`PFI.time` a numeric vector

Examples

```
data(Test_Norm_data)
## maybe str(Test_Norm_data)
## plot(Test_Norm_data)
```

Test_PI_data *Test PI data*

Description

This is Test PI data.

Usage

```
data("Test_PI_data")
```

Format

A data frame with 18 observations on the following 57 variables.

`OS` a numeric vector

`OS_month` a numeric vector

`AADACL4` a numeric vector

`ABCA12` a numeric vector

`ABCC3` a numeric vector

`ABI1` a numeric vector

Test_results *Test Results for Survival Prediction*

Description

A data frame containing survival prediction results for test samples. The data includes actual risk group labels, predicted risk groups, probabilities for each class, and overall survival data for the test samples.

Usage

```
data(Test_results)
```

Format

A data frame with 18 observations and 8 variables:

Sample_ID Character vector with the unique sample identifier (e.g., "TCGA-E1-A7Z6-01").

Actual Factor indicating the actual risk group: "High_Risk" or "Low_Risk".

Predicted_Risk_Group Factor indicating the predicted risk group: "High_Risk" or "Low_Risk".

High_Risk_Prob Numeric value representing the probability of the sample being classified as High Risk.

Low_Risk_Prob Numeric value representing the probability of the sample being classified as Low Risk.

Prediction_Prob Numeric value representing the maximum class probability (confidence in prediction).

OS_month Integer representing the overall survival time in months.

OS_event Integer indicating the survival event: 1 = death, 0 = censored.

Source

The data was derived from TCGA (The Cancer Genome Atlas) using survival prediction models.

Test_Uni_sig_data *Test Uni sig data*

Description

This is Test Uni sig data.

Usage

```
data("Test_Uni_sig_data")
```

Format

A data frame with 18 observations on the following 209 variables.

`A2ML1` a numeric vector

Details

This is Test Uni sig data.

Value

A data frame with columns X and Y.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(Test_Uni_sig_data)
## maybe str(Test_Uni_sig_data)
## plot(Test_Uni_sig_data)
```

`tr_test_f` *Train-Test Split Function*

Description

This function splits a given dataset into training and testing sets based on a specified fraction.

Usage

```
tr_test_f(data, fraction)
```

Arguments

`data`	A data frame containing the dataset to be split.
`fraction`	A numeric value between 0 and 1 indicating the proportion of data to include in the training set.

Details

The function checks whether the input `data` is valid and whether the `fraction` is a number between 0 and 1. It then performs a random split of the dataset into training and testing sets.

Value

A list containing two data frames:

train_data A data frame containing the training set.

test_data A data frame containing the testing set.

Examples

```
# Example dataset
data <- data.frame(x = rnorm(100), y = rnorm(100))
fraction <- 0.7
result <- tr_test_f(data, fraction)
head(result$train_data)
head(result$test_data)
```

`Train_Clin` *Train Clin*

Description

This is Train Clin.

Usage

```
data("Train_Clin")
```

Format

A data frame with 158 observations on the following 20 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

`histological_type` a character vector

`histological_grade` a character vector

`treatment_outcome_first_course` a character vector

`radiation_treatment_adjuvant` a character vector

`sample_type` a character vector

`type` a character vector

`OS` a numeric vector

`OS.time` a numeric vector

`DSS` a numeric vector

`DSS.time` a numeric vector

`DFI` a numeric vector

`DFI.time` a numeric vector

`PFI` a numeric vector

`PFI.time` a numeric vector

`OS_month` a numeric vector

Details

This is Train Clin.

Value

A data frame with columns X and Y.

Examples

```
data(Train_Clin)
## maybe str(Train_Clin)
## plot(Train_Clin)
```

`Train_Data_Nomogram_input`

Train Data Nomogram input

Description

This is Train Data Nomogram input.

Usage

```
data("Train_Data_Nomogram_input")
```

Format

A data frame with 158 observations on the following 34 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

`histological_type` a character vector

`histological_grade` a character vector

`treatment_outcome_first_course` a character vector

Details

This is train FPKM.

Value

A data frame with columns X and Y.

Source

https://portal.gdc.cancer.gov/

Examples

```
data(train_FPKM)
## maybe str(train_FPKM)
```

`Train_Norm_data` *Train Norm data*

Description

This is Train Norm data.

Usage

```
data("Train_Norm_data")
```

Format

A data frame with 158 observations on the following 2025 variables.

`Age` a numeric vector

`subtype` a character vector

`gender` a character vector

`race` a character vector

`ajcc_pathologic_tumor_stage` a logical vector

`histological_type` a character vector

`histological_grade` a character vector

`treatment_outcome_first_course` a character vector

`radiation_treatment_adjuvant` a character vector

`sample_type` a character vector

`type` a character vector

`OS` a numeric vector

`OS.time` a numeric vector

DSS a numeric vector

Train_results *Training Results for Survival Prediction*

Description

A data frame containing survival prediction results for training samples. The data includes actual risk group labels, predicted risk groups, probabilities for each class, and overall survival data.

Usage

```
data(Train_results)
```

Format

A data frame with 158 observations and 8 variables:

Sample_ID Character vector with the unique sample identifier (e.g., "TCGA-E1-5318-01").

Actual Factor indicating the actual risk group: "High_Risk" or "Low_Risk".

Predicted_Risk_Group Factor indicating the predicted risk group: "High_Risk" or "Low_Risk".

High_Risk_Prob Numeric value representing the probability of the sample being classified as High Risk.

Low_Risk_Prob Numeric value representing the probability of the sample being classified as Low Risk.

Prediction_Prob Numeric value representing the maximum class probability (confidence in prediction).

OS_month Integer representing the overall survival time in months.

OS_event Integer indicating the survival event: 1 = death, 0 = censored.

Source

The data was derived from TCGA (The Cancer Genome Atlas) using survival prediction models.

train_test_normalization_f *Train-Test Data Normalization Function*

Description

This function performs normalization on training and test datasets, which include clinical data and gene expression values. The function applies log transformation and quantile normalization to the gene expression values.

Usage

```
train_test_normalization_f(train_data, test_data, col_num)
```

Arguments

`train_data`	A data frame containing the training dataset. The first columns represent clinical data, and the rest represent gene expression data.
`test_data`	A data frame containing the test dataset. The structure is the same as `train_data`.
`col_num`	An integer specifying the starting column index of the gene expression data in the datasets.

Details

The function performs the following steps:

1. Splits clinical and gene expression data based on `col_num`.
2. Applies log2 transformation to the gene expression data.
3. Performs quantile normalization on the log-transformed data for both training and test datasets.
4. Combines the clinical data with the normalized gene expression data.

Value

A list containing four data frames:

Train_Clin A data frame containing the clinical data from the training dataset.

Test_Clin A data frame containing the clinical data from the test dataset.

Train_Norm_data A data frame containing the combined clinical and normalized gene expression data for the training set.

Test_Norm_data A data frame containing the combined clinical and normalized gene expression data for the test set.

Examples

```
# Example datasets
train_data <- data.frame(matrix(rnorm(100), nrow = 10))
test_data <- data.frame(matrix(rnorm(100), nrow = 10))
col_num <- 5
result <- train_test_normalization_f(train_data, test_data, col_num)
str(result$Train_Norm_data)
str(result$Test_Norm_data)
```

Train_Uni_sig_data *Train Uni sig data*

Description

This is Train Uni sig data.

Usage

```
data("Train_Uni_sig_data")
```

Format

Univariate_sig_features_f

Perform Univariate Survival Analysis

Description

This function performs univariate survival analysis on the provided datasets to identify significant features (genes or clinical features) associated with survival outcomes. It applies Cox proportional hazards models to compute hazard ratios and p-values for median expression cut-offs or clinical feature values.

Usage

```
Univariate_sig_features_f(
  train_data,
  test_data,
  col_num,
  surv_time,
  surv_event
)
```

Arguments

`train_data`	A data frame containing the training dataset. It must include survival time and event columns.
`test_data`	A data frame containing the test dataset. It must include survival time and event columns.
`col_num`	An integer specifying the column number in the dataset from which feature analysis should begin.
`surv_time`	A string specifying the name of the survival time column in the dataset.
`surv_event`	A string specifying the name of the survival event column in the dataset.

Details

The function first checks the validity of the input variables, such as whether the survival time and event columns are present in the training and test datasets. It then renames these columns to "OS_month" and "OS" internally for consistency. For each feature starting from the specified column number (`col_num`), univariate Cox proportional hazards models are fitted to assess the association between the feature and survival outcomes.

For clinical features, a similar process is applied, but the analysis is limited to the initial `col_num - 1` columns.

Significant features are determined based on a p-value threshold of 0.05. The function returns the significant features and their corresponding hazard ratios, p-values, and other related statistics for both training and test datasets.

Value

A list containing:

`Univariate_Survival_Significant_genes_List`
: A data frame of significant gene features with associated statistics.

`Train_Uni_sig_data`
: A data frame of selected significant gene features for the training dataset.

`Test_Uni_sig_data`
: A data frame of selected significant gene features for the test dataset.

`Univariate_Survival_Significant_clin_List`
: A data frame of significant clinical features with associated statistics.

`Train_Uni_sig_clin_data`
: A data frame of selected significant clinical features for the training dataset.

`Test_Uni_sig_clin_data`
: A data frame of selected significant clinical features for the test dataset.

`ZPH_Genes`
: A list of `cox.zph` objects for each gene feature, containing Schoenfeld residuals used to assess proportional hazards assumption.

`PH_Summary_Genes`
: A data frame summarizing proportional hazards test results for each gene, including p-values and indicators of assumption violation.

Examples

```
# Example data (requires real survival datasets for testing)
train_data <- data.frame(
  OS_month = c(10, 15, 20, 25),
  OS = c(1, 0, 1, 1),
  Gene1 = c(2.3, 3.4, 1.2, 2.5),
  Gene2 = c(0.5, 1.8, 0.9, 0.6),
  Clinical1 = c(1, 0, 1, 0)
)
test_data <- data.frame(
  OS_month = c(12, 18, 22, 28),
  OS = c(1, 1, 0, 1),
  Gene1 = c(2.0, 3.1, 1.0, 2.3),
```

```
  Gene2 = c(0.4, 1.5, 1.0, 0.7),
  Clinical1 = c(1, 1, 0, 0)
)
#result <- Univariate_sig_features_f(
#   train_data = train_data,
#   test_data = test_data,
#   col_num = 3,
#   surv_time = "OS_month",
#   surv_event = "OS"
#)
```
